

Note from Bill:

All, I needed 2 levels of magnification to read the part numbers on the leaded capacitors. I decided early on that "binning" them (so that I only had to do this once) was a "no-brainer". Also, I added a pic at the end of the transformer info that shows a cool way to keep the leads identified- strip a little insulation of some wires that has different colored insulation. I only used a short (~1/8 in) piece rather than the long pieces shown in the picture. Hope this helps.

Bill
